## Policy on the Use of Sodium Fluoacetate (1080) for Animal Pest Control.

JNL does not, and will not, support the dispersal of poison baits containing Sodium Fluoacetate (commonly called 1080 poison) on lands owned, leased, or managed by JNL.

JNL does not and will not support its land or land it leases being used as a staging place for the loading, storage or dispersal of poison baits containing Sodium Fluoacetate.

Applications by various officials and authorities to use JNL property for the above purposes will not be supported, but JNL will not actively resist legally justified instructions to provide landing sites.

JNL supports attempts to eradicate Bovine Tb infected wild animals but does not support broadcast poisoning programmes using 1080 poison as it contravenes the principles of environmental management pursued by the company through the company's HSEMS.

JNL actively promotes opossum and other wild animal control programmes by means of cyanide poisoning and trapping, as detailed in the various JNL Districts' Pest Management Strategy Documents.

  
M. Aoki
